

DAY 20 – PROBLEM SET II

Thursday, October 10th, 2019.

Problem Statement

You are a software engineer hired by a cinema franchise to create a point-of-sale program that will compute the price of movie tickets based on a customer's age.

System Requirements

1. The system operator should be able to enter the age of the customer.
2. The business logic of the program should generate the price of movie tickets based on the following criteria;

#	Category/ Days of the week	Kids (below 13)	Teens (Age 13 - 18)	Adults (above 18)	Students (Valid School ID)	Youth Corpers (Valid NYSC ID)
1	Sunday	500	1000	1500	750	750
2	Monday	500	1000	1500	750	750
3	Tuesday	500	1000	1500	750	750
4	wednesday	500	500	750	750	750
5	Thursday	500	1000	1500	750	750
6	Friday	500	1000	1500	750	750
7	Saturday	500	1000	1500	750	750

3. The program should then display the price of movie tickets in Nigerian Naira (default) as well as US Dollars; each proceeded with its appropriate currency symbol.
4. The program should also execute repeatedly until the system operator enters "Exit".
5. Save the program file as **tketer.js**

Bonus Points

1. Present the final output of the program in standard Receipt format.
2. Model the system using Use-case diagram.

Subm. Format: Node.js Command Prompt.

Subm. Date: Monday, October 21st, 2019.
